« We report a patient with acute postinfection membranoproliferative glomerulonephritis after the clinical multisystem manifestation of Lyme disease, which was confirmed serologically. Although the patient was dialysis dependent for a protracted period of 5 months, the final outcome was excellent“.

Chitale S, Burgess N, Barker THW, Roberts PF (2005) **Pseudospirochaetosis of the urinary bladder.** *J Clin Pathol* 58, 437–438. doi: 10.1136/jcp.2004.020529
<http://www.ncbi.nlm.nih.gov/pubmed/15790716>
« Special stains showed that the organisms were Gram and Giemsa positive, weakly argyrophilic, and Ziehl-Nielsen negative. Immunostains were negative for *Helicobacter pylori* and electron microscopy revealed curious curved bodies, which were difficult to classify. Therefore, this condition was described as pseudospirochaetosis of the urinary bladder. »

« *Borrelia burgdorferi* is a possible cause of post-infectious GN in humans as it is in dogs. Difficulties in identifying *Borrelia burgdorferi* may also be one of the reasons for the paucity of reports on the association of this infection with glomerulonephritis in humans. Currently, various types of histological renal lesions have been reported ».
